Aleksandar A., Mark K., Connor M.**

# INTRODUCTION

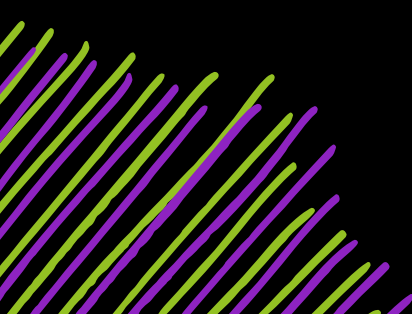

In this document we will walk you through our design process. Our task was not only to redesign an existing website, but also turn it into app and adding some new features.

We had to make an app where people, who take part in urban sports, to track their trainings. The main task was to make a user-friendly UI that satisfies the needs of our target audience. Our target audience is mainly young adults, because of that we tried to keep the design modern but also fun.

We started the design process with wireframe in order to see where we should position what. It also gave us an overview of what the app will look like – how many pages we will include and which will be the pages.

Then we continued with the high-fidelity prototype where we added colors and pictures, but also changed some of the pages in order to make them more user-friendly and more pleasant to look at.

Finally, we conducted some user-tests with potential users so that we can find our mistakes and to make the design even better.

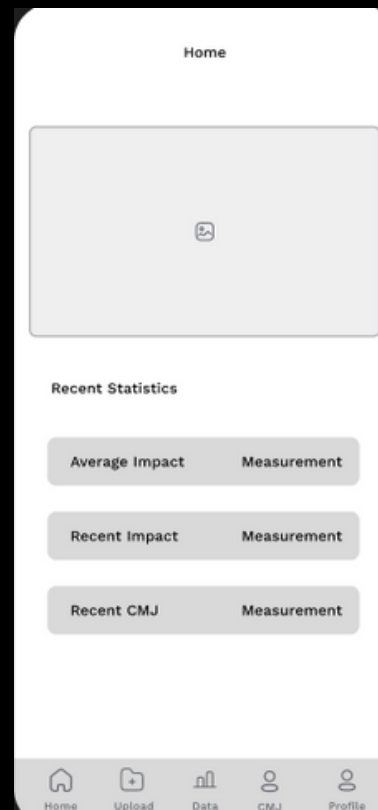

## WIREFRAME HOME PAGE

For the homepage we took inspiration from the health applications that are available when purchasing a smartphone. In particular, we took inspiration from Samsung Health and Apple's Health applications.

When creating the wireframe for the homepage we wanted to include the most important information for the person that will use our app. Since we are developing an application that focuses on training sessions' information, we decided that the average impact, most recent impact and the most recent CMJ(counter movement jump) are the most important pieces of information. We wanted to make each panel stand out and be its own piece of information.

After careful thought and consideration, we saw that showing only this on a homepage is not enough. We wanted to showcase to the user what our app was for and to make it a bit fun, rather than just a boring homepage with statistics.

After checking the materials provided in the beginning of the project, we decided to follow the approach of the previous people working on a product for our client – to use pictures. We decided that if there is a picture within our homepage, something that shows the user that the app is not only limited to statistics, but can also have its own vibe, the user would love it.

## WIREFRAME

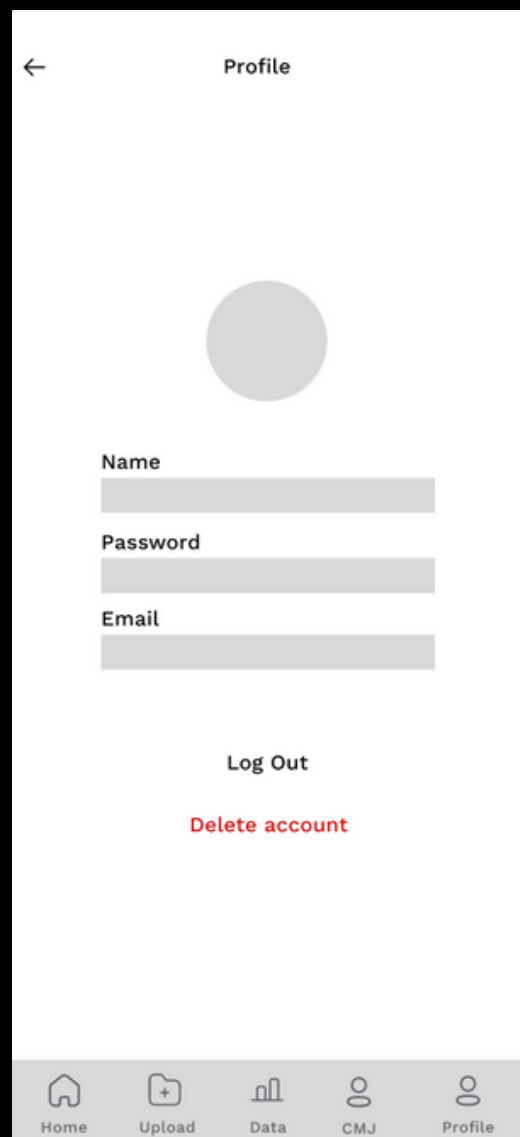

### ACCOUNT PAGE

We wanted to keep the account page as simple as possible, since this was not the main focus of our application. In the beginning we were only thinking of showcasing the name and email of the user, however, we quickly realized that this was not enough.

We wanted the user to be unique from the others. We pondered around the idea of having different styling for the different users, but quickly realized that this was not optimal as well and was going to be a waste of time, so we decided that we can have avatars for the users. It was a fun and unique way for each user to showcase himself and for us to distinguish the different users of our application.

Additionally we added the options to log off of your account and if the user decides, to delete their account. We added those options after looking at what modern applications are including in their own pages.

We also decided to add the option for the user to see his mobile phone. And to be able to edit any of the information provided by him that he wanted.

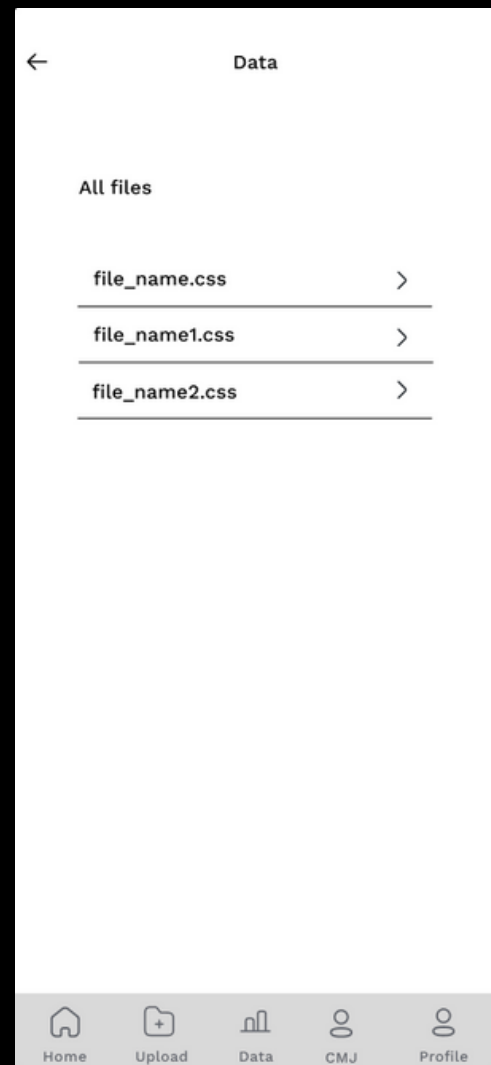

## WIREFRAME DATA PAGE

We had issues creating the data page as a whole. We did not fully understand the way the data was processed, which cost us a significant amount of time when we started working on the data page. We thought that the data was visible as soon as you upload a workout session, however, we quickly learned that this was not the case.

The new information that we learned helped us to polish the data page that we had in mind. The data was not accessible as soon as you upload the file to the app, because the logic behind it was not structured that way. Instead you had to select the data that you want to access, in order to then be able to see the statistics and graphs for the particular session.

That is why we decided to create the data page into two components, one that has all sessions and the user can decide which one to view and the other that is shown after the user selects a session that he wants to view.

This way we eliminate the problems that occurred when we asked the questions: “What if the user wants to see an older session?” and “What if the user wants to be able to see older sessions?”.

## WIREFRAME

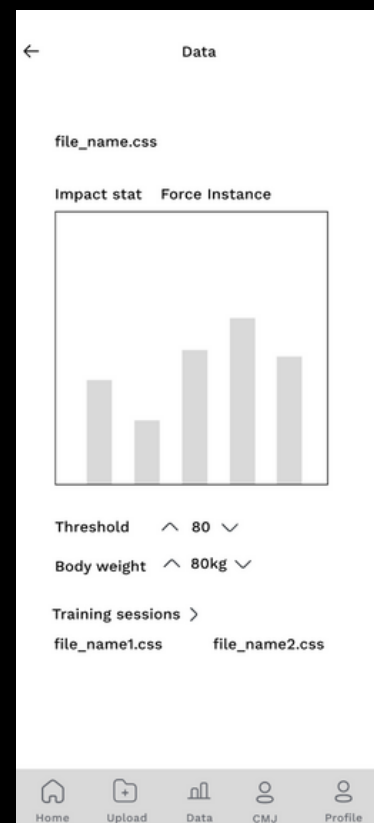

### DATA(INDIVIDUAL TRAINING SESSION)

About the Data page where we showcase different information that can measure fatigue we decided to have the structure in a vertical alignment.

Firstly at the top there will be a name of the file you clicked on as it shows which file the user is on and it doesn't lead to confusion if he clicked on the right training session. Secondly there are 2 buttons that will display the data in a different format, first being Impact Stats and second Force Instances this is done in order to make it easier for the user to understand the graphs as they will be different and depending on which one they look it can be easier to understand where you started to get more fatigued.

Then below is a threshold adjustment because some of the data shown isn't necessary as it showcases just the normal level of the activity, instead of the training session.

After that there is a body weight adjustment, because the data in the backend is adjusted based on the user's body weight and therefore the data in the graphs will be changed. Lastly there is a section with your recent training sessions and you can change your training information directly from the page if you want to have a comparison between your latest and few other sessions.

## WIREFRAME

### NAVIGATION MENU

What is an application good for if it has a confusing navigation? This is the question we wanted to answer with our wireframe. We were thinking of a way to simplify the navigation as well as to make it understandable where each button led.

We started with an idea of having a hamburger menu that could include all of the necessary buttons, however, as we continued developing our application we saw that we will not have as many pages as we originally thought we would.

We then opted for using a bottom navigation menu. We used a bottom navigation menu, because it was easier to distinguish the pages one from another with icons – something that is not well executed in a hamburger menu and because we did not have as many pages as we thought we would in our application.

## CMJ

For the CMJ page we had issues as there is no visualization of the data given in the original front-end provided by the client. So as for now we were thinking of displaying the data with a line graph as it can clearly show the x/y/z of the CMJ. Because a line graph can display the jump movement as accurately as possible, because they are good at showing progress overtime.

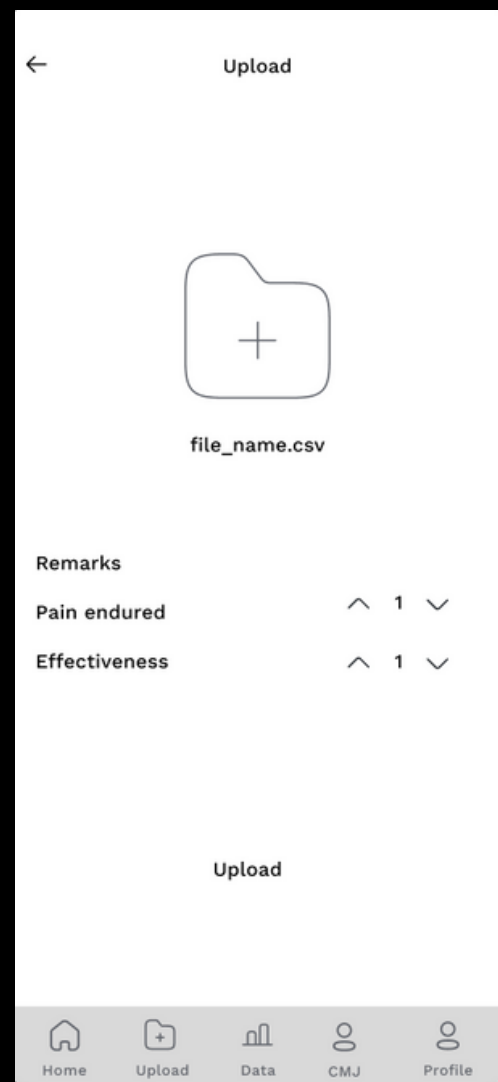

## WIREFRAME

### UPLOAD

Upload page is a page where the user will input a file from the xsens dot. This file later on will be used in the Data pages, firstly in the data(all session pages) where you can select a training session, and it will redirect you to the other data page for your individual training.

The upload page consists of a button which you click to get your xsens file from the device then it displays the name of the file underneath the button, after that you can adjust the pain and effectiveness from the training session, this is directly taken from the client front-end he gave us and he mentioned he wanted to keep it in the app. After that there is the upload button which uploads the file into the backend and you get redirected to a page where you can see all your sessions.

Overall this page is pretty simple as the client wanted to keep the main functionality he previously had.

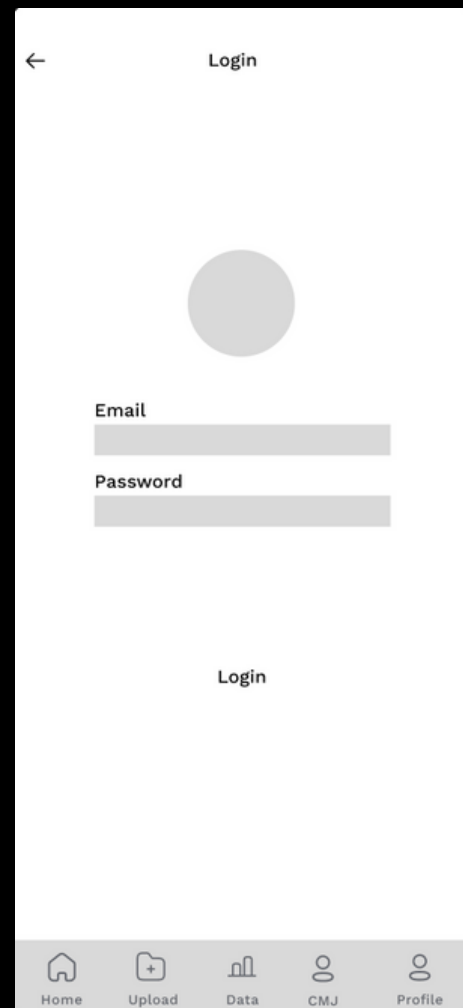

## WIREFRAME

### LOGIN

The login page serves as a portal for users to access their accounts. This allows them to view their sessions and have all their activities saved and easily viewable based on the account details. After successful login, users will be redirected to the home page.

This page features a 'Sign In' button along with two input fields, one for the email address and another for the password. Once a user registers and creates an account, they can use this information to sign in every time they use the app.

The design of the login page is intentionally minimalistic to ensure a user-friendly experience. It adheres to the standard conventions for login and signup pages, aiming to provide a simple and straightforward interface for users.

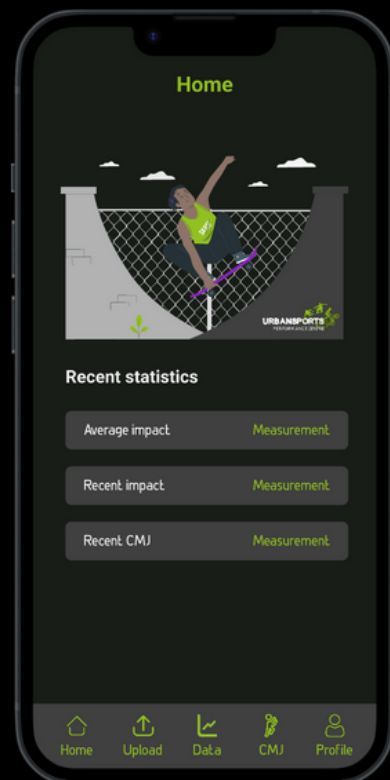

## HIGH-FIDELITY HOME

Firstly, we started with creating the Home page with the intentions to be our guide for the design for the rest of the pages. To have good contrast with the green colours that are part of Urban Sports' colour palette, we decided to use the black colour (#191D18) as a background.

To create a user-friendly experience, we added the name of each page at the top in green colour to make it pop. The only thing that the home page contains is the recent statistics, but we wanted to make the page look more fun and be more welcoming to the user. This is why we used a vector image of a girl skateboarding from Storyset, but it was fully customized since it fits the vibe of the app perfectly. We wanted to include the logo as well, so we added it to the ramp which gives more personal feeling to the vector image.

For the recent statistics, we chose grey-ish colour (#404040) because it is easy on the eyes but also there is enough contrast with the background. The measurements are in green colour in order to attract the users' attentions there. The whole page is based on the wireframes that were done before we started the prototype.

# HIGH-FIDELITY HOME

V1

V2

V3

We made 6 versions for the home page. We didn't choose V1 and V2 because when the boxes are colored they give a cheap look to the app and it is also not pleasant to look at. We chose V3, because it looks balanced and clean.

We didn't choose V4, because we decided the titles (e.g. "Recent statistics") to be in white colors so the users can differentiate them from the page titles (e.g. "Home"). We didn't choose V5 and V6, because when the titles are in purple they aren't readable enough.

V4

V5

V6

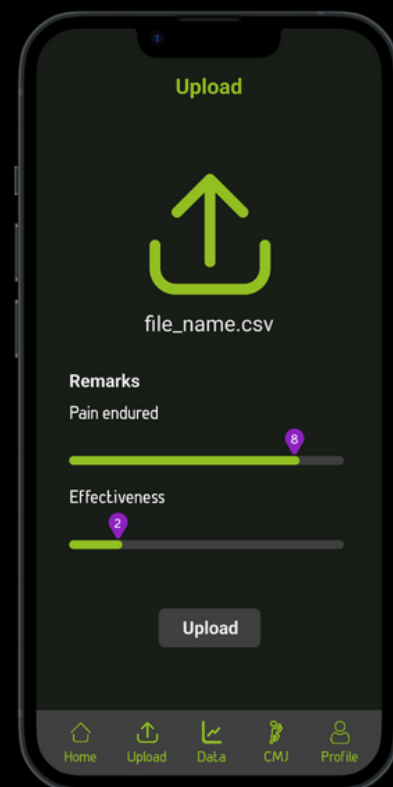

## HIGH-FIDELITY UPLOAD

After the home page, we started designing the upload page. It was based on the wireframe, however during the design process we did different versions and changed some parts from the wireframe.

We decided to use sliders to add your pain endured and the effectiveness since it will be easier rather than doing that with buttons. From the research we found out that a lot of people associate not only the green colour with Urban Sports, but the purple one. After discussing that with the client, he agreed to add the purple to the colour palette.

This is why we added accents of purple in this page. The number of the slider is located in a purple shape.

# HIGH-FIDELITY UPLOAD

We made 5 versions of the upload page. We didn't choose V1, because it was too green. We really liked V2, but we decided that with arrows it will be harder for the user to interact with the app. In V3 the purple wasn't readable enough.

We also really liked V4, but the same as V2 it wasn't user-friendly. We end up choosing V5, because of the sliders.

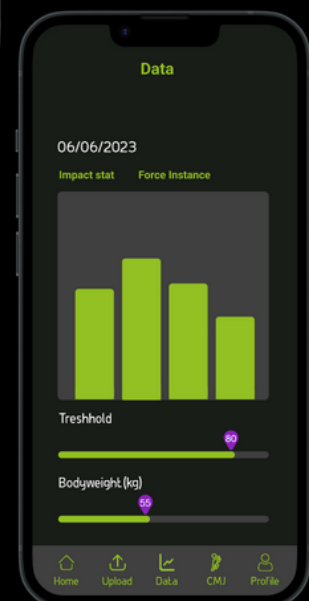

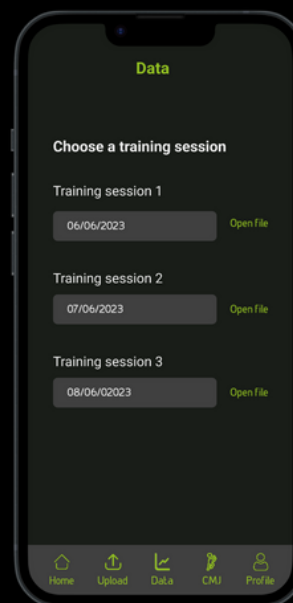

## HIGH-FIDELITY DATA

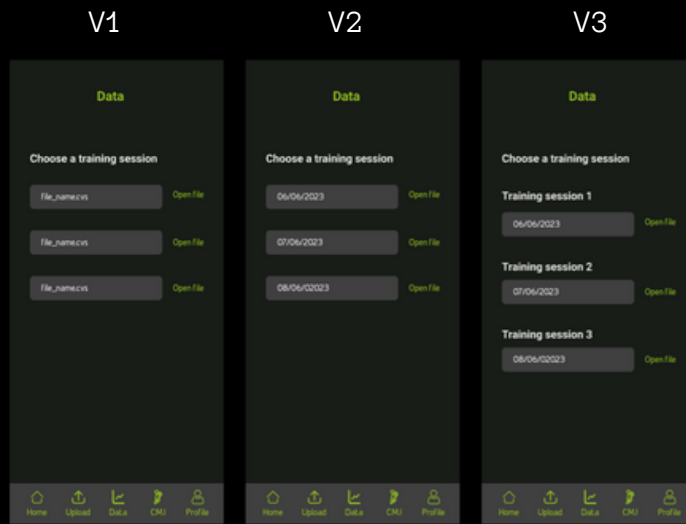

The design of the first data page is completely changed from the wireframe in order to keep it consistent with the rest of the pages that we have. We put the training sessions in grey boxes so it is similar as the home page.

We added the dates of the training sessions so the user can tell easier which training is which. The buttons "Open file" are green to add a pop of a colour. The title "Choose a training session" is white in order to be consistent with the rest of the pages that we did already. When the user opens a file, he goes to a page where he can see that stats. He can regulates the treshhold and the bodyweight with the same sliders that we added to the upload page. The graph is in grey square and the bars are green in order to create a good contrast.

At the top the user can see again the date of the training session, this keeps is more user-friendly since the user can always check if he opened the right file.

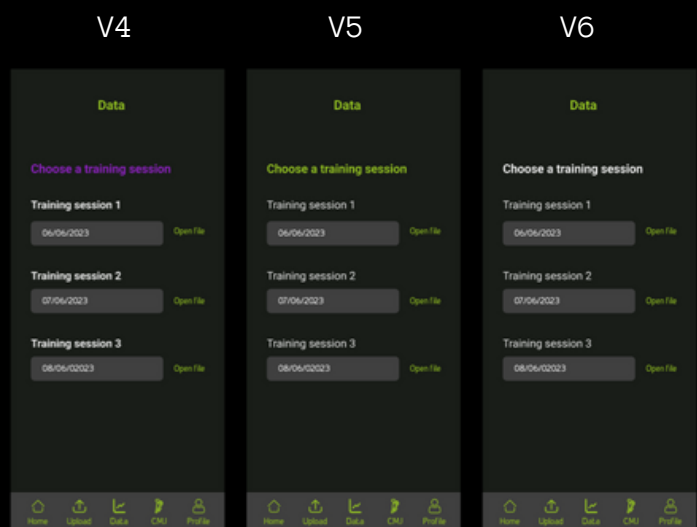

# HIGH-FIDELITY DATA

We made 6 versions for the home page. In V1 the we left the files with their names, however in V2 we tried to add the dates instead. However, both looked simple. This is why in V3 we use the dates, but also the name of the training session.

In V3 we played with the colors, but the purple title wasn't readable enough. It wasn't consistent with the rest of the design and that is the same reason we didn't choose V5. However, in V5 we tried to make the titles with regular font and not bold, and we liked the way it looked. This is why we implemented that in V3, so V6 is the same but with regular sized titles and we end up choosing that version.

# HIGH-FIDELITY DATA

In the first three versions (V1, V2 and V3), we wanted to play with the colours regarding the graphs. In V1 and V2, the graphs give cheap look to the app and in V3 there isn't enough contrast so it is a little bit hard to look at.

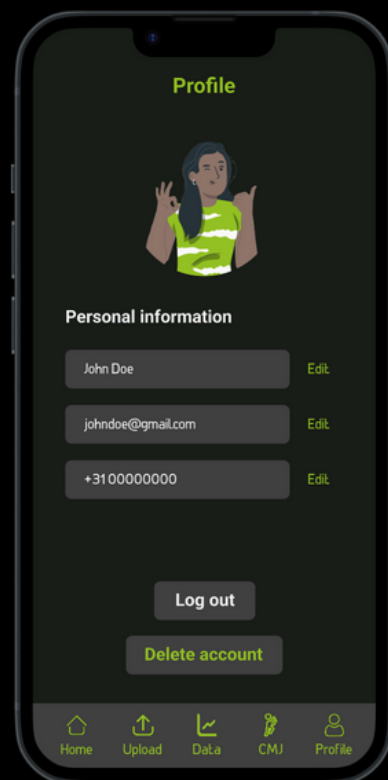

In V4, we made the graph with grey color and green bars since this is consistent with the design. In V4 and V5 we wanted to implement to choose the threshold and the bodyweight with the arrows, but we ended up decided it is better to use sliders. That is why we chose V6.

## HIGH-FIDELITY PROFILE

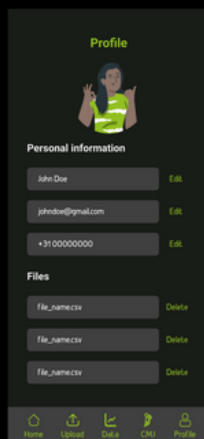

The profile page was made fully following the design of the wireframe. We added a vector image of the same girl that is skateboarding in the home page. The personal information is kept in grey boxes and the edit button is green – this follows the colour design of the data page.

The log out button is the same as the upload button from the upload page, however delete account button is green in order to make the user think before clicking on that button.

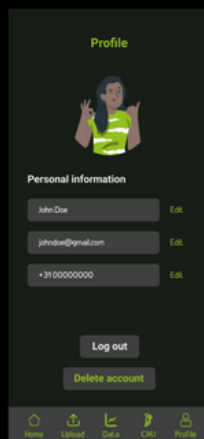

## HIGH-FIDELITY PROFILE

V1

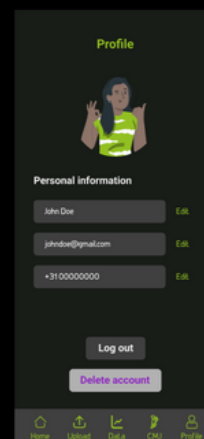

V2

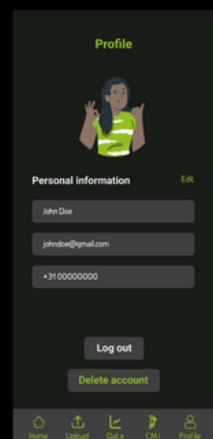

We made 4 versions of the profile page. At first we wanted to implement the files data in there, but decided it's not logical for that information to be in the profile so we didn't choose V1 because of that. We all liked V2, so we chose that one for the prototype, because the green color is balanced and it is pleasant to look at.

We wanted to experiment with the delete button, since it has to be a little different from the other buttons, we tried to make the button white with purple in order to give it more contrast, but it gave cheap look to the app. In V4 we made only one edit button next to the title, which also looked good and is user-friendly in our opinion, but we preferred V2.

V3

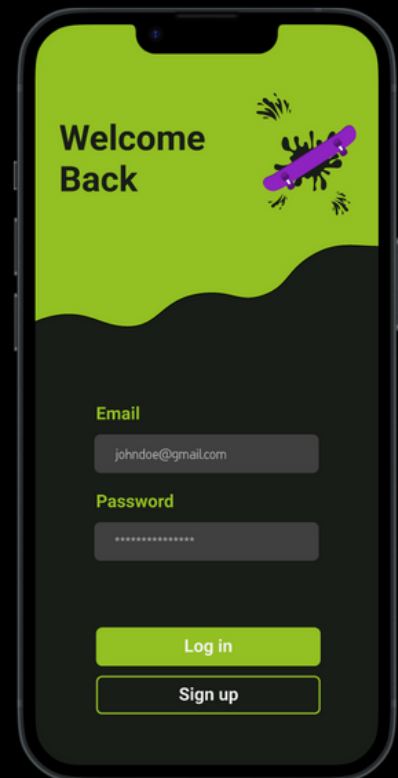

V4

## HIGH-FIDELITY LOGIN

The log in page wasn't made by following the wireframe. We wanted to make it fun but yet to keep it simple. There is a green shape that contains the welcome back message, a skateboard that is in front of splashes (we used those since they are part of the design system of Urban Sports).

The skateboard is purple in order to make a contrast with the green background and the black splashes. Then there are two inputs that are following the design of the previous pages that we made and two buttons.

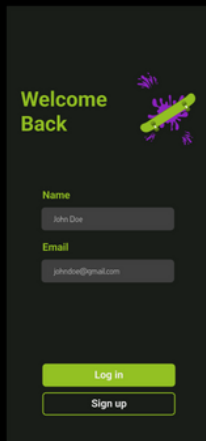

## MENU

The menu we made is simple. We used the grey-ish colour again as a background. We used icons and text (both in green so it can create a good contrast) for more user-friendly experience.

In V1 we came up with the idea to have a skateboard and a splash, however the whole look of the page was weird. In V2 we added the green form as a background, and put the skateboard like it is going on it, however it looked off. We chose V3, because the contrast was good.

V4 is almost the same as V2, the only difference is the Sign up button, however the page still looked incomplete in a way. In V5, we played with the colors, but the contrast wasn't good and you can barely see the skateboard, because the users' eyes first go on the purple.

## USER-TESTING

User-tests play crucial part in our designing process. This is the time when we can gather feedback from potential users. The users interacting with the design helps us to improve the design itself.

The interviewee's name is Dimitar, he is 21 and he is from Bulgaria. His hobby is skateboarding and he lives alone.

When doing the five second testing, the interviewee said that the image of a person skateboarding stands out. He mentioned that the gray color on the navigation menu stands out as well. The first task – logging in, he did it with ease, however, the second one – to open a training session was a bit difficult for him. He found his way eventually, however he mentioned that the navigation menu is confusing to him, especially the 'Data' screen. When thinking aloud he said that the 'Home' screen should not be named like that, because it is a summary for different statistics.

The interviewee thinks that the application is easy to navigate and easy to use. He said that he liked the idea of an app being minimalistic and complimented the images used within the app. He liked the green color that was used for the majority of the app.

After asking him to describe the app in three words, he said the app was minimalistic, easy to use and easy to navigate.

In conclusion the interviewee would not add anything to the app, but rather change the navigation menu names in order for them to be less confusing.

## USER-TESTING

The interviewee's name is Nikoleta – a 21 year old student.

She was given the task to do a 5-second testing, Nikoleta said that she thinks the app is about something connected with skateboarding because of the vector image, she also remembered the title “Recent statistics”. Lastly, she mentioned that she remembered that the app was dark-themed but with a pop of bright green colors.

After that the interviewee had to do two tasks. The first one was to log out of the app and then log in again. She had no issues with completing the given task. The second one was to go to training sessions, however she experienced some issues with the navigation bar but eventually she finished the task.

After that, Nikoleta had the freedom to walk through the app. She liked the design, she enjoyed the balance of the green color. She found the UI interesting, different and helpful. Overall, she liked the app, but she mentioned that she experienced some issues with the navigation bar.

The interviewee's name is Borislav – a 21 year old student.

He was given the task to do a 5 second testing where he is shown only the home screen. After the testing he said that he remembers the big image in the middle where he saw a girl skateboarding, and 3 boxes underneath that display some kind of information. And he liked the color scheme and remembered the colors green and purple.

## USER-TESTING

Afterwards he was given the task to login into the app, which he did pretty easily, then he was asked to open the training session page and he seemed to be a bit confused as it took him noticeably more time than the previous task. When asked what he thinks of the app he said that he thinks the app is about exercises and measures something. He said he had some issues with the navigation as it wasn't easy to find the training sessions. He thinks the app is pretty straight forward otherwise and does its job correctly.

Overall the user had good impressions of the app as he liked the concept, the colors and the UI. But he had some issues navigating through the app with the navbar so there should be changes in that.

In conclusion, after carefully analyzing the feedback and user experiences, it has become evident that the navigation bar posed minimal difficulties for potential users. However, upon closer examination, it was discovered that the primary cause of these minor issues stemmed from the naming of the pages rather than any inherent flaws in the design or functionality of the navigation bar itself. We have applied the changes to the app directly.
