

URBAN SPORTS

PERFORMANCE CENTRE

RESEARCH DOCUMENT BY:

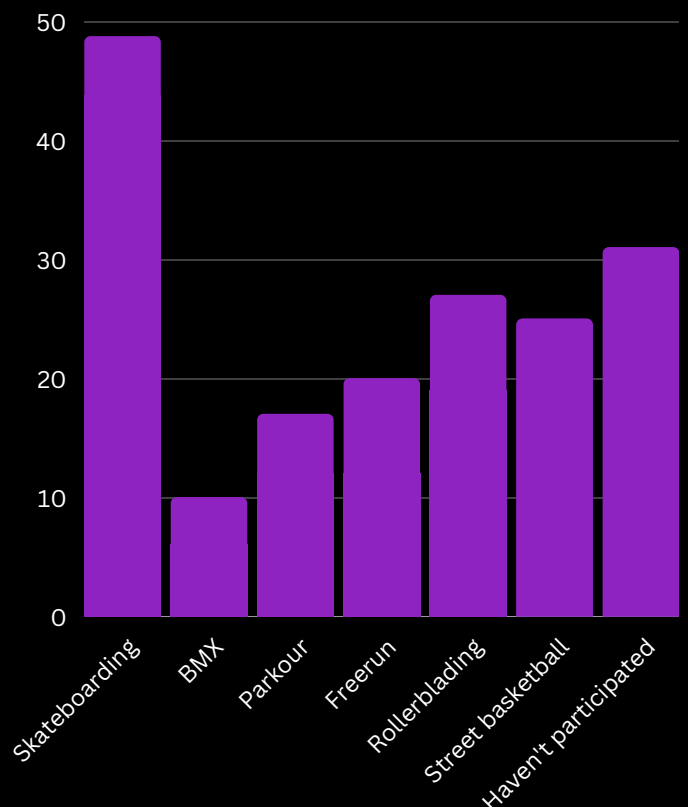

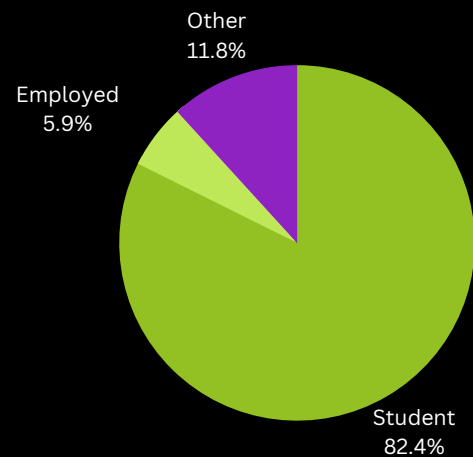

**Ivan G., Rik H., Yoana I.,
Aleksandar A., Mark K., Connor M.**

SURVEY

Even though we were given a clear task by our client, we decided that conducting survey is an essential tool for getting insight into the exact design flaws of the current website. It also helped us to find out more about potential users. By understanding the needs and wants of the users, we can create more effective design that is tailored to the specific needs of the people.

All of the users that have answered the survey are between the age of 18 and 24. Most of the participants are from Bulgaria, however some of them are from the Netherlands. The majority are students (82%), some are employed (6%) and some answered with other (12%).

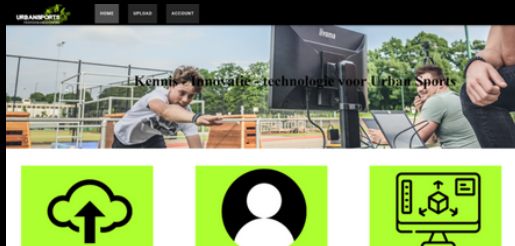

The users have participated in variety of different urban sports. Most of them have done skateboarding (44%). Some of them have also participated in street basketball (25%). Others have done also rollerblading (19%), freerun (12%), parkour (12%), bmx biking (6%). On the other hand, some people haven't participated in any urban sports (31%).

SURVEY

The participants had different answers about the colours they think of when they hear Urban Sports. There are 4 main colours that are mentioned – green, yellow, purple and red. Most of them say that they imagine vivid, bright colours or neon.

The participants had to share their opinion on the home page of the website. Most of them agree that the text isn't readable. Some mention that it looks unfinished. According to the users, the icons aren't user-friendly as well. However, most of the people that have answered, like the green colors.

Most of the users haven't used an app that helps them track their progress during training (76%), but they are likely to use an app – average rating is 3.5.

The users were asked to answer what they think this page is about. Most of the people were confused, they share it is statistics, but have no idea what about. Only two of the participants guess it is about intensity of your workout.

From the survey, we have gathered a really important information that will help us continue with the designing process. The targeted audience is young adults (18-24), which means the design should be modern and clean with interesting accents. The participants liked the green colour, which means that we will keep that, but since they mentioned other colours that they think of when they hear urban sports, we will add a new accent colour to the palette. Also we will aim for more user-friendly design with more information – especially for the statistics.

INTERVIEWS

As part of the research, we conducted interviews to gain valuable insights and perspectives. These interviews involved carefully selected participants with relevant knowledge or experiences related to the research topic. Through structured yet conversational discussions, we aimed to uncover nuanced information and explore the complexities surrounding the subject. The insights gathered from these interviews contribute significantly to the overall findings and analysis of the research.

The interviewee's name is Dimitar, he is 21 and he is from Bulgaria. His hobby is skateboarding and he lives alone.

Upon seeing the website, the interviewee said that square shapes stand out. His first impression was that the website is mediocre and he was not sure what the website was about, the interviewee only managed to read the name of it. He mentioned that the homepage's text is hard to read, the navigation is confusing, and he mentioned that the design is ok. The interviewee likes the squares that are used, however, he believes that the idea was badly executed.

The interviewee thinks that the website is not user-friendly. After asking him what the website was about, the interviewee said that it was about some sort of training. However, he was not sure, because the website's labels are in dutch. The interviewee said that he would change a lot of things, for example, he would remove the squares or make the navigation better. He said that he would keep the fundamental design, but will expand on it. When asked to explain the website in three words the interviewee said that the website was: simplistic, not finished and not the best.

In conclusion a redesign of the already established website must be made before proceeding forward with the project.

INTERVIEWS

The interviewee's name is Andrei, he is a 21 years old student from Romania. His hobby is BMXing and he lives with a roommate.

When he saw the website for the first time he remembered the upload button from the navbar and the three green squares, and his first impression of the website was that it was pretty basic. He mentioned that the three squares could be made to look more like a button, so this is definitely a flaw in the website as the three squares are currently buttons. He seemed to like the color green and the color scheme in general. He doesn't think the website is user friendly as he has to assume what the three squares do.

After going through the website he liked the upload page and overall thought the website is a dashboard. He is still having issues with the buttons, he didn't like that the images inside them are not centered. When asked to explain the website in three words he said that the design is overall simplistic and minimalistic.

In conclusion there is one thing that is definite and that is that there should be re-design of the website.

The interviewee's name is Nikoleta – a 21 years old ICT student from Bulgaria. In her free time she likes reading books and going out with her family and friends. She also enjoys going to the gym and she used to skate, but not anymore. Nikoleta is currently living in a house with 7 more roommates.

She did a 5-second testing of the home page of the website. Her first impression was that there were a lot of things happening that was messy, but she remembered green colors, also big circle shapes with icons inside.

INTERVIEWS

Nikoleta walked through the whole website and she finds it really hard to navigate in it and she also mentioned she didn't understand anything. She finds the website outdated because of the shapes, in her opinion modern websites have more rounded shapes/corners. After seeing the whole website she figured out that the page is about sports, but only because of the logo and because it says training on one of the pages. Nikoleta will change the colors, she would rather use more soothing greens. She explained the design in 3 words – confusing, messy, outdated.

The interviewee's name is Jakub – a 22 years old ICT student from Czech Republic. His main hobby is skateboarding, but programming and photography as well. He is currently living alone.

He did a 5-second testing of the home page of the website. Jakub didn't understand what the page was about, but he remembered the words account and upload and also the navigation at the top. He remembered the picture of the kid trying to reach out for something. He also remembers neon green colors. His first impression of the website is that it is outdated.

Jakub walked through the website and was confused for many reasons, but the main thing is the language – some things are in Dutch and others are in English. From the graphs page, he liked the bottom graph. After seeing the whole website, Jakub thought that it looked like a dashboard. He said that he is confused because you can have a 2 hour training session and you wouldn't know which part of the graph was for a specific part of the training. Jakub mentioned that he would add information which part of the training was the damaging one (based on the newtons). He had to explain the design in 3 words, but he only thought of two – outdated and confusing.

INTERVIEWS

The interviewee's name is Giada, she is a 22 years old student from Italy. She lives with two roommates.

When she first saw the site she remembered the buttons, a picture and the color green. She mentioned that there were three different buttons. Her first thoughts are about how there seems to have nothing like a name or any explanation. She liked the color green and the color scheme overall. She doesn't think the website is user friendly because there is no explanation and the icons don't make sense.

After going through the website she liked the layout and the simplicity of the different buttons but didn't like that the upload and sign in pages are both using a different shade of green but overall it is usable.

When asked to explain the website in three words she said that the design is overall simplistic but doesn't make sense and it needs to have more explanation and design.

In conclusion the basic design of the site is fine but a redesign of the pages and more explanation of what each thing does is needed.

To sum up, all of the interviewees had unpleasant experience with the website. They found it confusing, which means we should focus on better positioning and hierarchy of the elements. Most of the users mentioned that they don't like the design of the square buttons on the home page, so that is another thing we will focus on. Everyone seemed to like the pop of the green colour, however some interviewees noticed that there are different shades of green on the different pages so we will try to fix that and keep the app consistent.

PERSONAS

Personas are important result from our research. We based them on the survey and the interviews. By utilizing personas, we can make informed design decisions that are aligned with the target audience's needs. This way we can focus on their pain points and make their experience better.

**Kaloyan
Georgiev**

Occupation
Student

Location
Bulgaria

Age
20

Family
Single

Personal traits

Empathy

Communication

Biography

Kaloyan is a student from Bulgaria, that likes to skateboard in his free time, but also to play street basketball sometimes. He associates urban sports with the colours green and purple.

Needs

- User-friendly app to keep track of his progress during trainings

Pain points

- Outdated UI of the website
- Doesn't understand what the statistics are actually about

PERSONAS

**Adam
Svoboda**

Occupation
Student

Location
Czech Republic

Age
22

Family
In relationship

Biography

Adam is a student who loves to skateboard in his free time. Sometimes he also does BMXing. He is currently living in a student house with 3 roommates.

Needs

- A better UI of the existing website

Pain points

- Confusing design
- Inconsistent use of the color green

Personal traits

Empathy

Communication

In conclusion, both personas are people that like to participate in urban sports in their free time. However, both need more user-friendly design in order to be able to use the app. Because the two personas are young adults, we should focus on creating more fun and modern design.

EMPATHY MAP

Empathy map is a tool that we used in order to gain a deeper understanding of our users or customers. This helps us shift the focus from our own assumptions to that of the users. This is created based on the interviews.

THINKS

Buttons are just images

The text is hard to read

The idea behind the website is good

There should be more on the website

DOES

A lot of checking of each page

A lot of checking of the navigation

Only when hovering the buttons, realizes they aren't images

SAYS

"The coloyr scheme is nice"

"I want the images to be centered"

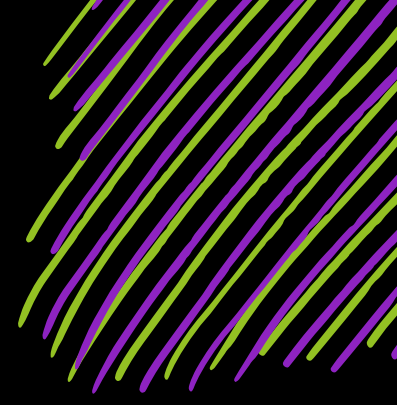

"The navigation is confu-sing"

FEELS

Confused

Good idea but poorly made

Unhappy

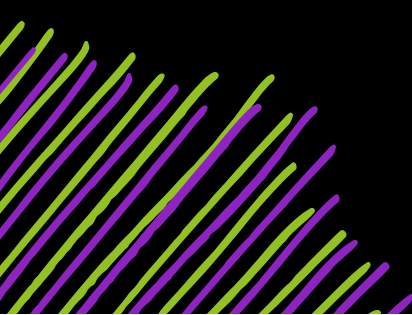

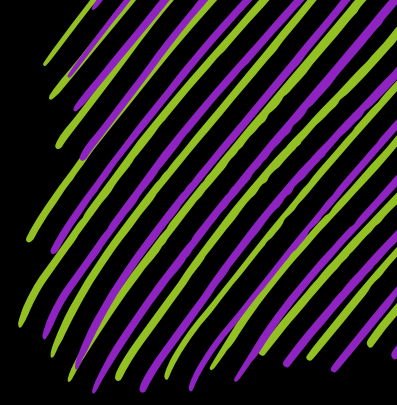

LIBRARY RESEARCH

COUNTER-MOVEMENT JUMP: AN ESSENTIAL TECHNIQUE IN SPORTS PERFORMANCE AND FATIGUE MEASUREMENT

The counter-movement jump is a jump that is supposed to activate every aspect of a jump and is able to check fatigue based on the height and force of the jump itself. At the beginning of any jump the the subject will start out at a flat 0 and then when they duck down will go to negative and then at the very end the user jumps and it goes positive, the peak of the jump is where most of the stats are important because based on this the amount of fatigue on the subject can be found. It is crucial for different sports like skateboarding and parkour because there are constant impacts and tracking fatigue after an exercise is essential. According to Owen from ScienceForSport “The countermovement jump (CMJ) is a simple, practical, valid, and very reliable measure of lower-body power. As a consequence, it is no surprise that this has become a cornerstone test for many strength and conditioning coaches and sports scientists “. It is a simple test to conduct but there are some basic conditions that need to be taken into account “If the environment is not consistent, the reliability of repeated tests at later dates can be substantially hindered and result in worthless data.” Overall CMJs are essential and are applicable to lots of different sports and are an accurate way to measure fatigue

The counter-movement jump (CMJ) is a comprehensive technique designed to activate aspects of a jump, thereby facilitating the measurement of fatigue based on the height and force of the jump (Owen, n.d.). A typical jump initiates at ground level, dips to a negative value as the jumper crouches, and ends positively as the jumper launches into the air. The peak of the jump is particularly crucial for assessing fatigue, given that the majority of relevant performance statistics are derived from this phase (Owen, n.d.).

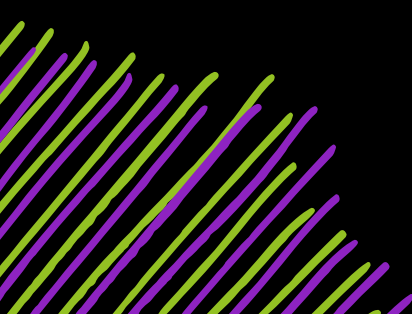

LIBRARY RESEARCH

COUNTER-MOVEMENT JUMP: AN ESSENTIAL TECHNIQUE IN SPORTS PERFORMANCE AND FATIGUE MEASUREMENT

The CMJ is integral to high-impact sports such as skateboarding and parkour, where ongoing fatigue measurement is crucial for performance tracking and injury prevention. As Owen (n.d.) from ScienceForSport elucidates, the CMJ is "a simple, practical, valid, and very reliable measure of lower-body power," which underscores its prevalence as a testing metric for many strength and conditioning coaches and sports scientists. However, the consistency of the testing environment is paramount to ensure the reliability of repeated tests over time and the utility of the resulting data (Owen, n.d.)

In conclusion, the CMJ provides an efficient and reliable way to measure fatigue across a wide range of sports, thus highlighting its importance in the field of sports science.

We chose to research more about this topic, because we want to understand better why an user would use that app. This reasearch gave us better understanding of the whole functionality behind the concept.

AFFINITY MAP

We used affinity map as a tool to help us organize all the information gathered from the research so far. By grouping all the data, it helps us to keep everything we found so far structured. This way we can also easily spot recurring patterns.

STORYBOARD

Storyboard is a tool that helped us visualize a possible scenario in which an user finds the app and has a pleasant experience with it.

Anna is stressed, because she experience pain in her knees after she skates, but doesn't know why.

She searches online for answers and she finds the app from Urban Sports Centre and downloads it.

Anna starts keeping track of her trainings and sees when her movements are dangerous for her knees.

She becomes more cautious during her skateboarding sessions and doesn't experience knee pain anymore.

POV&HMW

In order to maintain a user-centered focus, we used POV&HMW method. This helped us for our ideation process and to define the problem even more precisely.

POV

A user who wants to check his training data and compare it for improvement, but is confused to do so.

HMW

Show the user's data in easy and understandable way.

Track the data and showcase the improvement over time.

Ensure that the shown data is accurate.

Ensure that the data can be displayed easily without causing confusion.

POV

A user who wants to use his xsens dot device as easily as possible, but cannot do so.

HMW

Identify the easiest way to showcase the data from the device to the app.

Make the data understandable but at the same time detailed as possible.

Make the experience between using the xsens dot device and app fluid?

Create an efficient and effective way of collecting the data from the xsens dot device and store it in our app?

MOSCOW

We created a MoSCoW in order to know on which parts we should focus more. This ordered the features based on what the client's desires are.

M

- New design
- Fluid way of uploading the sensors data to the app
- Improved UI
- A way of monitoring fatigue

S

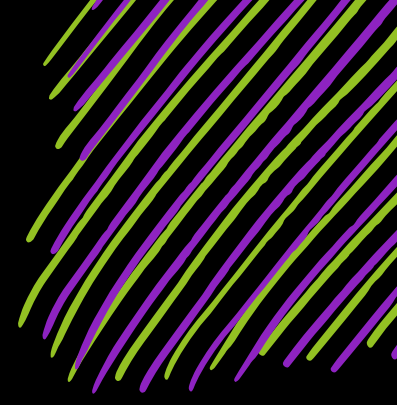

- Showing force as a % of the bodyweight
- Fine tune

C

- Showing the playerload
- Better subjective load questionnaire

W

- Support for different languages
- Improved force measurements

CONCLUSION

Based on the research, we found out that our target audience is young adults (18–24 years old). This means that the design should be clean and modern, yet innovative in a way. From the surveys and the interviews, we found out that the users like the green colour, however a big group of the people also associate urban sports with the purple colour, so we would aim to add small accents of that in the app. From the gathered interviews, the participants found the already existing website confusing – none of them managed to understand what the website is about. This mean we should focus on create more user-friendly experience and make the app informative. Our main challenge will be to make the statistics informative and easily-understandable for everyone.
